Hello,

In this new version, the list of storage has increased, so we can still write on:

- localStorage or on memory with localstorage.js
- WebDAV servers with davstorage.js

But we also can use several storage handlers, like:

- indexstorage.js to index documents and to make the allDocs method faster
- gidstorage.js to make global ids from document metadata to enable interoperability between storages
- replicatestorage.js associated with gidstorage.js to write on several storages with synchronized data
- splitstorage.js to split document data and metadata on several storages
- revisionstorage.js to manage revision for document management and conflict resolution
- replicaterevisionstorage.js to write on several storages with sychronized revisions

See full [documentation here](#).

Thanks,
Tristan Cavelier
